

**Title:** CHEMICAL INVENTORY

**Principle:**

The laboratory will maintain an inventory of all hazardous chemicals used in each work area. See also Chemical Hygiene Plan.

---

**Procedure:**

- A. **Chemicals Used in the Laboratory** - chemicals are used in all areas of the laboratory. Refer to the attached chemical inventory list for the location of hazardous chemicals used in each laboratory section. Chemicals not included on this list will be included in our MSDS file or those for which no MSDS exist or those we have determined, with all the information available from safety references or the manufacturers, that no hazards exist with normal work practices used in the lab. Before performing any procedure, each employee should be familiar with all chemicals used.
- B. **Right to Know** - it is the right of each employee to know the chemical hazards which exist in the laboratory. Information concerning chemical hazards is found in this safety manual, in the MSDS forms, in the chemical inventory listing, and in the references available in each laboratory section or the laboratory office. It is the responsibility of each employee to follow safe work practices inherent in all laboratory work and to be familiar with the safety manual and the safety practices described therein.
- C. **Identification of Chemical Hazards** - the laboratory uses a variety of mechanisms to alert the lab worker to the presence of chemical hazards. These include labels, signs, MSDS, procedures, training, PPE, chemical inventory list, and monitoring. In addition, both **odor** and **visual appearance** of chemical should alert the laboratory worker to investigate whether hazardous chemicals are present.
- D. **Classification of Chemicals**
  1. **Corrosive** refers to any substance that causes visible destruction or irreversible alterations in human tissue at the site of contact. When applied to chemical waste, the term implies a pH <2.1 or >12.5, or the ability to corrode steel (SAE 1020) more than 0.25 inches/year at 130\_F. Example: strong acids; strong bases.
  2. **Toxic** is a term that can be applied to almost any substance in quantity. Note: MSDS sheets frequently list chemicals as toxic that may not be toxic at amounts commonly used in

**Written by:** Gail Zander, CT (ASCP), 6/20/2012

**Attachments:** 2012 Anatomical Pathology Chemical inventory.

**Approval of Procedure:**

Medical Director Signature: *m. Gail Zander, MD*

Date: *8/29/12*
